# 5 of the 13 Important Functions of a Nurse

What is a nurse?

A nurse is a medical professional who provides general patient care and triage. Nurses usually work with a team of other medical professionals, such as physicians and other healthcare specialists. Nurses can work in a wide variety of environments, including:

- Hospitals
- Clinics
- Doctors' offices
- Schools
- Correctional facilities
- Homeless shelters
- Rehabilitation centers
- Senior care homes

**Caring is the essence of Nursing**

# 4 Elements Of Nursing

Four major concepts are frequently interrelated and fundamental to nursing theory: person, environment, health, and nursing. These four are collectively referred to as metaparadigm for nursing.

## Person

Person (also referred to as Client or Human Beings) is the recipient of nursing care and may include individuals, patients, groups, families, and communities.

## Environment

Environment (or situation) is defined as the internal and external surroundings that affect the client. It includes all positive or negative conditions that affect the patient, the physical environment, such as families, friends, and significant others, and the setting for where they go for their healthcare.

## Health

Health is defined as the degree of wellness or well-being that the client experiences. It may have different meanings for each patient, the clinical setting, and the health care provider.

## Nursing

The nurse's attributes, characteristics, and actions provide care on behalf of or in conjunction with the client. There are numerous definitions of nursing, though nursing scholars may have difficulty agreeing on its exact definition. The ultimate goal of nursing theories is to improve patient care.
